Intermittent delay before health response

Support evidence pack | 20 paired comparisons | 40 complete sanitized requests

The first paired requests were slow on both the custom domain and the native Sites hostname. Both later returned fast responses. This capture documents the symptom; it does not identify the platform component responsible or establish that the hosting issue is resolved.

CUSTOM: 20 requests; 1 slow, 18 fast, 1 intermediate. TTFB min / median / max: 35.817 / 48.171 / 2924.072 ms.

NATIVE: 20 requests; 1 slow, 18 fast, 1 intermediate. TTFB min / median / max: 40.522 / 52.959 / 3598.520 ms.

Two slow requests

```
Pair 01 custom: a404102bd9953517-JNB
Start 2026-09-24T19:05:53.249000Z | TTFB 2924.072 ms
Pair 01 native: a404102bee431560-JNB
Start 2026-09-24T19:05:53.249000Z | TTFB 3598.520 ms
```

All 40 requests returned HTTP 200 and curl exit code 0. No authentication or cookie request headers were sent. Sensitive response headers and TLS ticket detail remain redacted exactly as in the source capture.

Deployment boundary

v92 succeeded at 2026-09-24T19:05:47.546350Z. All 40 requests started after deployment completion; zero ended before it and zero spanned the boundary. v92 changes independent quote/signing read scheduling; the health route was unchanged. Deployment completion is supplied by the owning agent, not inferred from curl.

```
Deployment: appgdep_6ab5746f20688191a5211422ace04609
Environment revision: 34
```

Matched application Worker timing

Owning-agent correlation: custom Ray a404102bd9953517 invoked at 19:05:56.158Z, wall 11 ms, CPU 10 ms; native Ray a404102bee431560 invoked at 19:05:56.836Z, wall 7 ms, CPU 6 ms. Both outcomes were ok. These are separately supplied log summaries; raw Worker traces are not part of the JSON capture.

This is not a before/after performance comparison. TTFB includes client and platform processing. The matched app invocations were short, but the precise source of the preceding delay remains unproven.

Contents: methodology and provenance, complete sample index, then all sample fields, response header blocks and complete sanitized curl verbose traces. Long source lines wrap with a continuation marker; original line numbers are retained.

Methodology and provenance

20 pairs; each custom/native pair dispatched concurrently from Johannesburg VPS; fresh curl process per request; one-second spacing between pairs; no authentication or cookies sent; default curl configuration disabled with -q. Slow TTFB >=1s; fast >0 and <0.2s. Full response header blocks and verbose output sanitized in memory before saving. Set-Cookie and credential-like header values redacted.

Timing fields are cumulative seconds measured from curl transfer start. Differences between adjacent phases describe intervals. In particular, time_starttransfer - time_pretransfer estimates the wait after request preparation; it is not a measured server-only duration. No timing is rounded in the detailed evidence.

Requests within each pair were concurrent; each request used a fresh curl process. Pairs were separated by one second. The paired comparison reduces timing skew between hostnames but is not an independent cold-start experiment, and later requests may benefit from any shared caches or initialized platform state.

Targets are read-only public health endpoints. No new probes were made to create this PDF. The report is a searchable rendering of the supplied sanitized JSON; no credentials have been reconstructed.

Capture validation

```
total_requests: 40
all_http_200: True
all_exit_zero: True
no_auth_or_cookie_request_headers: True
sensitive_response_headers_redacted: True
first_start_utc: 2026-09-24T19:05:53.249+00:00
last_end_utc: 2026-09-24T19:06:17.532+00:00
```

Source integrity

```
Filename: HOSTING-SUPPORT-PAIRS-20260924.json
SHA-256: 4005d719b9f755d8a4877e0c9402af60bedf085dacad044b3910ca5fde89c5e5
Created UTC: 2026-09-24T19:06:17.532+00:00
Source bytes: 261606
```

The JSON remains the machine-readable source. The PDF preserves all sample fields, all original response header blocks and every sanitized verbose line. Whitespace-only visual wrapping is added for print readability.

All 40 captured requests

Index values below are milliseconds. Full precision in seconds appears in each detailed sample. All samples are post-v92.

Pair	Target	Start UTC (19:xx:xx.xxx)	TTFB ms	Class	CF-Ray
